POPULATION AND CIVILIAN LABOR FORCE PROJECTIONS FOR NEW JERSEY: 1990 TO 2030

INTRODUCTION

This report presents population and civilian labor force projections for the state of New Jersey from 1990 through 2030. The projections were developed by the New Jersey Department of Labor's Division of Labor Market and Demographic Research. The projections incorporate population and labor force counts by age, race, and sex from the 1980 census, as well as 1987 provisional population estimates. They revise and supersede all other projections previously issued by this Department. For the first time, population projections by age, race, and sex are presented through the year 2030, along with projected median age for each race-sex population group and labor force projections by age, race, sex from 1990 to 2010.

This report (Volume I) is the first of two projection reports. It includes the state-level projections resulting from four sets of projection models. The Economic-Demographic Model, designated as the preferred model, is based on both economic and demographic inputs. The Historical Migration Model is a purely demographic projection that is based on migration trends from 1980 to 1985. The last two models are included mainly for illustrative purposes. They are the Zero Migration Model, also a demographic model, which assumes no net migration at the state level; and the Linear Regression Model which is a straight-line extrapolation of total population from 1900 to 1987. The same models are applied to develop county-level projections which are presented in the second report (Volume II).

The first part of this report (Tables 1 through 4) contains total population for New Jersey from each of the four models. Tabulations of state population by 18 age groups, race (white and nonwhite), and sex from the preferred Economic-Demographic Model are presented. Similar tabulations for New Jersey's civilian labor force by seven age groups, race (white and nonwhite), and sex from the Economic-Demographic Model are presented in the second part of this report (Table 5 through 7). All projections are available by five-year intervals through the projection years (2030 for population projections, 2010 for labor force projections).

Only one set of projections is designated as preferred. The Economic-Demographic Model was designated preferred because of the greater scope of the input information, and because the projections from this model are consistent with the year 2000 employment projections by industry and occupation which were recently released by this Department,[1] not because of any superior predictive qualities. Also, along with the Historical Migration Model, it is a technically well-established projection technique. Projections users may wish to view the Economic-Demographic and Historical Migration Models as establishing a range for potential population change in the future, since both techniques are theoretically superior to the Zero Migration and/or Linear Regression Models. A narrow range indicates that projected labor market conditions produce a migration pattern similar to the pattern prevailing in the early 1980s, and that a certain consistency exists between the economically-based migration of the Economic-Demographic Model and the demographically-based Historical Migration Model. On the other hand, a wide range indicates that projected labor market conditions produce a different migration pattern from that of the past years. However, users should not attribute any predictive qualities to the projections.

Baseline Projections--Not Forecasts and Not Goals

The numbers in this report are projections, not forecasts or predictions. A projection is the measurement of a future condition that would exist if the rules and assumptions of the method proved to be empirically valid in the future. Projections may assume continuations of past conditions, present conditions, or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgemental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts.[2] Again, numbers in this report are projections.

Furthermore, the projections in this report are not to be interpreted as goal or policy oriented. They are not intended to constrain or to advocate specific levels of growth in the state. All series are presented as baseline, that is, independent of exogenous public or private interventionist activities of an unusual, unforeseen, or undocumented nature or magnitude. They are based primarily on identifiable, demographic and economic secular trends which have been implicitly or explicitly incorporated into the models. The greatest value of the projections is as a reference framework for planning, policy evaluation, and considerations of alternative growth scenarios which could be achieved through greater or less resource development.

No Special Adjustments

The projected 1990 population was adjusted to be consistent with the 1987 population estimates, and this was the only special adjustment in this projection series. In addition, the state-level projections serve as the control for the county projections, which are presented in Volume II.

No special adjustments were made with respect to the impact of the Atlantic City hotel-casino industry, the Pinelands Plan, nor the Preliminary State Development and Redevelopment Plan (November 1988).

No special adjustments were made for future population growth associated with the Atlantic City hotel-casino industry, since the employment growth in the hotel-casino industry has progressed sufficiently to provide an historic data base and because of the model's economic nature, the Economic-Demographic Model can account for the anticipated population growth associated with the hotel-casino industry. To the extent that at least some of the demographic effects of the hotel-casino industry were reflected in demographic trends through 1985, the demographic impact would be included in the Historical Migration Model, and to a lesser extent, in the Linear Regression Model.

The first hotel-casino opened in mid-1978, three were open at the time of the 1980 census, and twelve had opened by 1988. The Zero Migration Model, of course, would not be affected by hotel-casino growth since it includes no migration. Because the Linear Regression and Zero Migration Models are included in this report mainly for illustrative purposes, no special adjustments for hotel-casinos were deemed necessary.

In addition, no special adjustments were made for the impact of the development restrictions of the Pinelands Comprehensive Management Plan. In the case of the Pinelands, the assumption was made that growth will be redirected within the counties of the Pinelands and that the present projections do not indicate growth beyond limits imposed by the Pinelands Plan, with the possible exception of Ocean County after the year 2000 in the Historical Migration Model. The Pinelands plan seeks to allocate growth to designated "regional growth areas." The Pinelands Commission states that these areas will be more than adequate to accommodate regional housing demand projections.[3]

Finally, no adjustment was made for the potential impact of the Preliminary State Development and Redevelopment Plan. As previously mentioned, the numbers in this report represent projections, rather than predictions, forecasts, etc. On the other hand, the State Planning Commission similarily views projections initially as "points of departure'" but will develop targets for monitoring purposes. As stated in Volume I of the

Preliminary State Development and Redevelopment Plan:[4]

> **The Preliminary Plan identifies population and employment projections that the Commission believes are reasonable "points of departure" for discussion and negotiation during cross-acceptance ... After receipt of County reports at the end of the comparison period of cross-acceptance, and following a period of negotiation with the counties to resolve inconsistencies, the Commission will evaluate how realistic these projections are and make appropriate adjustments and revisions to formulate targets for these variables in the final Plan ... These revised and new targets will then be used in the monitoring and evaluation program to assess progress after the final Plan is adopted.**

POPULATION PROJECTIONS

THE ECONOMIC-DEMOGRAPHIC MODEL

The Economic-Demographic Model, designated preferred, is based on standard demographic projection procedures, but assumes employment growth to be the major determinant of migration in and out of the state for persons under 65 years of age. The model is therefore driven primarily by labor demand in the state -- subject to one major caveat. After 2000, employment growth was constrained significantly below historic rates, to rates consistent with projected levels of national immigration, settlement patterns of immigrants from abroad, and the State's relative attraction to job-seekers from elsewhere in the nation. Low fertility rates and the entrance of the "baby boom" into retirement -- in the absence of loosening of immigration quotas or other unforeseen events -- can be expected to constrain employment growth. Of course, economic growth might not be restricted even if employment growth were constrained, if productivity increased sufficiently. But, in terms of the model, labor supply constraints at the national level would restrict state employment and population growth after 2000, in spite of the basic demand orientation of the model.

---

[4] The New Jersey State Planning Commission, The Preliminary State Development and Redevelopment Plan for the State of New Jersey, November 1988, p. 25.

The Cohort-Component Method

The basic projection procedure used in this model is known as the "cohort component method." For each five-year cycle of the projection, a base population distribution by age, race, and sex is "aged" five years. Each five-year age group is reduced through a survival ratio to account for mortality during the five years. Births are computed by applying five-year age-race-sex-specific fertility rates to the female age groups from 10 to 49. After adjustment for mortality through a survival ratio, the five years of births become the projected group 0 to 4 years of age. Net migrants are added to the resulting projected population by age, race, and sex. This procedure is repeated for each five-year interval in the projection period.

In the present model, the cohort-component method is applied to the household population only. The group-quarters population is assumed constant throughout the projection period. Specific inputs and their methods of development are discussed separately below.

Base Population

The base population used in the Economic-Demographic Model is taken from the decennial census of April 1, 1980, which provides resident population by age, race, and sex in households and group quarters. Age is defined by five-year groups from age 0 to age 85, with an open category for age 85 and over.

The definition of race requires special consideration, as race was treated differently in the 1980 Census than in previous censuses. In the 1980 Census, persons who did not classify themselves in one of the specific listed race categories but reported a non-racial entry (usually, but not always, a Spanish origin designation) were included in a residual "other" races category. In the 1970 Census, however, most of these persons were included in the "white" category.

Since the 1980 Census, many administrative data sources as well as the U.S. Bureau of the Census' national population projections[5] and U.S. Bureau of Labor Statistics' labor force projections[6] have reflected the racial classification developed by the U.S. Office of Management and Budget (OMB). Therefore, in order to be consistent with national projections and other sources of administrative data, which are based on the OMB racial classifications, an OMB-like modification was applied to redistribute the 1980 census white and nonwhite populations to more nearly match the OMB classifications. OMB reclassifies persons from this residual "other" category to the specified categories according to the following procedures: (1) Persons of "other" race and Mexican origin are assigned to white, (2) Persons of "other" race with other Hispanic origins are assigned to white and black based on the distribution of persons of the same origin who originally specified white or black race, (3) Persons enumerated as "other" race and not of Hispanic origin are reassigned to all three race groups - white, black, and others on the basis of state-specific proportions based on sample data from the 1980 census.[7]

---

[5] U.S. Bureau of the Census, Current Population Reports, Series P-25, No. 1018, Projections of the Population of the United States, by Age, Sex, and Race: 1988 to 2080.

[6] U.S. Bureau of Labor Statistics, Bulletin 2302, Projections 2000, March 1988, pp. 17-27.

The 1980 Census figures for New Jersey were adjusted similarily. Specifically, persons in the "other" races category who identified themselves to be of Spanish origin in a separate question were distributed by race in the same proportion as persons of Spanish origin who identified their race. Persons of "other race" but not of Spanish origin were distributed in the same proportion as non-Spanish persons of identified race. A comparison of the population of New Jersey as of April 1, 1980 before and after modifications is shown below:

	White	NonWhite	Total
1980 Census counts	6,127,467	1,237,356	7,364,823
OMB modification	6,311,522	1,053,301	7,364,823
NJDOL modification	6,310,835	1,053,988	7,364,823

The 1980 age-race-sex distribution determined in this way was projected to 1985, and adjusted to be consistent with the revised 1985 population estimates[8] and a 1985 experimental population estimates by age-race-sex extrapolated from 1984 estimates.[9] Thus, the base population reflects the demographic characteristics of the latest decennial census and recent trends.

[9] See footnote 7 for information regarding the experimental population estimates.

Fertility and Mortality

Age-specific fertility rates by race were used to compute births to women in each five-year interval. The fertility trend was determined from the national "middle series" projections of fertility by age of mother and race.[10] Rates for the state were adjusted to reflect the relationship of the state rates to the national rates in 1985,[11] and were assumed to gradually converge to national rates by the year 2040.

As a consequence of this assumed national trend, fertility rates for whites and nonwhites converge through the projection period, declining steadily for nonwhites and increasing slightly for whites. The 1985 New Jersey birth statistics implied 1.61 children per woman among whites and 2.01 children among nonwhites. Nationally, by the year 2050, white and nonwhite rates are projected to converge to 1.8 children per woman.

Similar reasoning was used in the projection of mortality. State survival ratios by age, race, and sex were projected on the basis of the U.S. Census Bureau's "middle mortality assumption" for the nation, but reflecting the 1980-85 mortality differences between New Jersey and the nation. Similar to national mortality projections, the projected New Jersey survival ratios were assumed to be constant after the year 2025. The source of mortality information for New Jersey was also the New Jersey Department of Health.

---

[10] See footnote 5 for national fertility and mortality projections.

[11] Fertility rates by age of mother and race, New Jersey, 1985 are derived from New Jersey Health Statistics, 1985, Center for Health Statistics, New Jersey Department of Health.

Migration of Persons 65 Years of Age and Older

Migration patterns of persons 65 years of age and over are assumed to follow migration patterns estimated from trends for the 1980-85 period. Rates by age, race, and sex were inferred from the five-year change in birth cohorts, and by an adjustment to the revised 1985 estimates of the population 65 and over.

Migration of Persons Under 65 Years of Age

Projected migrants of persons of working age and children are based on the projected civilian labor market, and constitute the assumption that distinguishes this model from purely demographic models. In simple terms, an over-supply of labor relative to demand for workers results in a net out-flow of persons from the state while high demand relative to supply results in a net in-flow of migrants. Net migration is therefore based on the size of the civilian labor force needed to balance the labor market.

Labor supply is estimated by applying projected labor force participation rates to civilian noninstitutional persons 16 years of age and over in the population projected without migration. These rates are based on national labor force projections by age, race, and sex produced by the U.S. Bureau of Labor Statistics until 2000. After 2000, rates of certain age-race-sex groups that declined in 1990-2000 period are assumed to be constant while others continue to increase gradually until the year 2015. When the majority of "baby boom" cohort has past the primary working ages (ages 25 to 54) in the year 2015, the participation rates of all age-race-sex group are projected to increase under the assumption that the tight labor market would result in high participation.

Labor demand is determined by employment projections adjusted to a residence basis. Employment projections reflect the historical growth of industries in the State. Until 2000, employment projections are exogenous. After 2000, State employment is constrained to maintain a constant share of a national level of employment that would be feasible under U.S. Census Bureau's national "middle series" projections.[12] As stated earlier, such a constraint implies a much lower rate of employment growth than historic trends would indicate. However, such constraints were imposed due to existing national immigration policy, expected relative demand for labor from elsewhere in the nation, low fertility rates, and the aging of the "baby boom". Adjustment of employment to a residence basis is necessary due to commutation across state boundaries.

Finally, net migration of the labor force is determined by the balance of demand and supply, allowing for a level of unemployment projected for the State. The resulting labor force net migrants are adjusted to include children and adults outside of the labor force, and are distributed by age, race, and sex according to the migration patterns of the 1980s.

ALTERNATIVE DEMOGRAPHIC MODELS

The remaining three projection models in this report present population growth scenarios that could occur under different input assumptions. The Historical Migration Model is based on the trend in net migration rates by age, race, and sex inferred from population data over the 1980-85 period. Like the Economic-Demographic Model, it uses established demographic techniques. The projections from both of these models may be used as a range for possible population change in the future. The Zero Migration Model and the Linear Regression Model are primarily illustrative, and are intended only for comparison to other models.

---

[12] See footnote 5 for description of "middle series" projections.

The Historical Migration Model

Like the preferred Economic-Demographic Model, the Historical Migration Model is also a cohort-component projection. The assumptions regarding the base population, fertility, and mortality are the same as those of the economic model discussed above. Net migrants by age, race, and sex are determined by inferring migration from 1980 to 1985 based on: the 1980 census, the 1984 experimental estimates by age, race, and sex, and the revised 1985 population estimates. The inferred level of migration is then converted to net migration rates. Rather than inferring migration under 65 by economic factors, the Historical Migration Model applies the past net migration rates directly to the population distributed at each projection interval. Migration rates are assumed to converge by race and sex, so that net migration is dependent only on age by 2020. Thus, the model is purely demographic: future components of population change are an outgrowth of past components of population change.

The Zero Migration Model

The Zero Migration Model is presented as an illustrative projection of the population change that would occur in New Jersey in the total absence of net migration. As migration tends to be the major distinguishing factor in sub-national projection models, a model that eliminates it altogether can provide a useful analytical tool. Comparing the Zero Migration Model with either the Economic-Demographic or Historical Migration Models reveals the impact of migration on population growth according to each of the two models.

Like the two models previously discussed, the Zero Migration Model is also a cohort-component projection. The base population, as well as projected fertility and mortality are the same as that assumed in the previous two models. Age-race-sex-specific migration rates are all set to zero for the State. However, the projected 1990 population includes the inferred net migration between 1985 and 1987, since the 1990 population has to be consistent with the 1987 population estimates.

Linear Regression Model

The Linear Regression Model is presented primarily for comparison to the Economic-Demographic and Historical Migration Models. It hypothesizes that the population growth observed in New Jersey from 1900 to 1987 will continue until 2030. Unlike the three other models, it is not a cohort component projection, but a simple extrapolation of past total population trends. The main feature of the model is the extensive history of population change on which it is based.

The method employs ordinary least squares regression on a time series for the state. Total population measured by decennial censuses from 1900 to 1980 and the revised 1987 estimate are regressed on time, the resulting equation is applied to the time period from 1990 to 2030, and the series is adjusted to be consistent with the 1987 benchmark.

CIVILIAN LABOR FORCE PROJECTIONS

Projected civilian labor force is obtained by applying the projected age-race-sex specific labor force participation rates to the civilian noninstitutional population aged 16 years and over derived from the Economic-Demographic Model. The institutional and military population in New Jersey are assumed to be constant at its 1980 level through the projection period. The projections of total population and labor force participation rates are discussed in the previous sections of this report.

There are some differences between the data on labor force and participation rates published in the decennial census reports and those in the U.S. Bureau of Labor Statistics' (BLS) publications. Numbers published by BLS are based on annual averages computed from sample surveys (i.e., Current Population Survey) of approximately 70,000 housing units or living quarters in the nation for a 0.07 percent sample.[13] The census, on the other hand, documents the labor force for the week immediately preceeding the census (April 1), based on a sample of approximately 17 percent of the total population. The data in this report are more closely aligned with the decennial census figures.

---

[13] U.S. Bureau of the Census, Current Population Survey, March 1988 Tape Technical Documentation, pp. 5-6.

PRESENTATION OF RESULTS

The present report provides summary tables for each of the four models of population projections (Table 1), as well as some detail by age, race, and sex for the preferred Economic-Demographic Model (Tables 2 through 4). In addition, projections of civilian labor force are given for the preferred model (Tables 5 through 7). The summary table provides projected total population in five-year intervals from 1990 through 2030, as well as the 1980 census figures (modified), and 1987 estimates that serve as the control for the projections. Table 2 provides a distribution by 18 age groups. Table 3 provides distribution by race and sex. Table 4 contains age-race-sex detail, five-year age groups, for 1980 and each five-year interval from 1990 to 2030. The same coverages as that in tables 2-4 for civilian labor force, 1990 to 2010 are presented in tables 5-7 repectively except that labor force is divided into seven, instead of 18 age groups.

An upward revision of New Jersey population in the 1980 census is included in Table 1 (the summary table), but not in the detailed tables. This results in a discrepancy of 188 persons in the population totals for New Jersey in 1980. Furthermore, all projected figures are rounded as appropriate such that there may be small discrepancies between distributions and totals due to rounding.

Also available on request, but not as a formal publication, are distributions of population by age, race, and sex according to the Historical Migration Model.

CAUTION ON INTERPRETATION

As noted at the outset, projections are not forecasts. The publication of four series is intended partly to demonstrate the varied nature of projection models. In addition, the Economic-Demographic Model and the Historical Migration Model may be viewed as a range of population and labor force alternatives for the State. The present set of projections is the first series produced by this division that reaches to the year 2030, and includes detail labor force figures. Particular caution is advised in interpreting results beyond the year 2000, as the plausibility of historically based assumptions declines with increasing departure from the base year. Projections are by their nature biased in favor of continuity. There is generally little basis for projecting substantial departures from past trends, so few such departures are projected. Yet, there is little doubt that unforeseen changes will occur. In particular, the assumptions in the Economic-Demographic Model including the constraint on employment growth after the year 2000 are based on current and/or recent conditions which may change dramatically.

The Division of Labor Market and Demographic Research hopes that users of these projections, both interested agencies and individuals, will comment on them. Please direct all comments, suggestions, and requests to Labor Market and Demographic Research, New Jersey Department of Labor, CN 388, Trenton, New Jersey 08625-0388. The Demographics Unit's telephone number is (609) 292-0076.

Table 1. Projection of Total Population: New Jersey, 1990 to 2030

ACKNOWLEDGEMENT

This report was prepared by **Sen-Yuan Wu**, Division of Labor Market and Demographic Research, Office of Policy and Planning, New Jersey Department of Labor.

The author is grateful to Dr. Frederick W. Hollmann of U.S. Bureau of the Census for his advice on assumptions and methodologies. The author appreciates the input and assistance provided by the field analysts of the Divison of Labor Market and Demographic Research and from the NJSDC network's county affiliates:

Atlantic County	Max Slusher
Bergen County	Jim Hulsizer
Burlington County	Susan E. Payne
Camden County	J. Douglas Griffith
Cape May County	Ed Filipski
Cumberland County	Carl Holm
Essex County	Nicholas Koval
Gloucester County	Susan Weber
Hudson County	Patrick Fay
Hunterdon County	Barry Bourquin
Mercer County*	Rudy Pernell
Middlesex County	Lou Mattei
Monmouth County	Carol Scott
Morris County	Raymond Zabihach
Ocean County*	Susan Ney
Passaic County	Elizabeth Newton
Salem County	Charles Munyon
Somerset County	Laurette Kratina
Sussex County	Lou Budd
Union County	Joyce Garry
Warren County	Bernard Rooney

* The contact person of this county has been changed recently.

Population and Labor Force Projections for New Jersey:
1990 to 2030

INTRODUCTION

Population and labor force projections for the 21 counties in New Jersey are published in this report. The projections were prepared by the New Jersey Department of Labor's Division of Labor Market and Demographic Research. They incorporate county-level population counts by age, race, and sex from the 1980 census, as well as 1987 provisional estimates. They revise and supersede projections previously issued by this Department. For the first time, population projections are presented through 2030. Labor force projections through 2010 are also included.

This publication (Volume II) is the second of two projection reports. It includes county-level projections resulting from four sets of projection models. The designated preferred Economic-Demographic Model is based on both economic and demographic inputs. The Historical Migration Model is a purely demographic projection based on migration trends from 1980 to 1985. The last two models are included mainly for illustrative purposes. They are the Zero Migration Model, also a demographic model, which assumes no net migration at the county level, and the Linear Regression Model which is a straight-line extrapolation of total population trend from 1900 to 1987.

The Economic-Demographic Model was designated preferred because of the greater scope of the input information, not because of any superior predictive qualities. Also, along with the Historical Migration Model, it is a technically well-established projection model. Projection users may wish to view the Economic-Demographic and Historical Migration Models as establishing a range for potential population change in the future. A narrow range is indicative that projected labor market conditions produce a migration pattern similar to the pattern prevailing in the early 1980s, and that a certain consistency exists between the economically-based migration and the demographically-based migration. On the other hand, a wide range indicates that projected labor market conditions produce a different migration pattern from that of the 1980s. Users, however, should not attribute any predictive qualities to the projections.

Baseline Projections--Not Forecasts and Not Goals

The numbers in this report are projections, not forecasts or predictions. A projection is the measurement of a future condition that would exist if the rules and assumptions of the method proved to be empirically valid in the future. Projections may assume continuations of past conditions, present conditions or trended changes in historical conditions. They may also assume entirely new transition rates. Given the method and the assumptions, a projection is always correct if the operations of the projection method are carried out without error. The number of possible projections for any given population is therefore infinite. A forecast, on the other hand, is a projection that is also a judgemental statement concerning the expected measurement of future conditions; it is a prediction. All forecasts are projections, but not all projections are forecasts.[1] Again, numbers in this report are projections.

Furthmore, the projections in this report are not to be interpreted as goal- or policy-oriented. They are not intended to constrain or to advocate a specific level of growth in any area of the state. All series are presented as baseline, that is, independent of exogeneous public or private interventionist activities of an unusual, unforeseen, or undocumented nature or magnitude. They are based primarily on identifiable, demographic and economic secular trends which have been implicitly or explicitly incorporated into the models. The greatest value of the projections is as a reference framework for planning, policy evaluation and considerations of alternative growth scenarios which could be achieved through greater or lesser resource development.

THE PROJECTION MODELS

The following is a brief summary of the major characteristics of the four projection models. A more thorough description of the models and their inputs is contained in the text portion of Volume 1, pages 6 through 15. All four models have as their base population July 1, 1987 provisional estimates produced by the Division of Labor Market and Demographic Research.[2] Distribution of the population by age, race, and sex is determined from the census of April 1, 1980 and experimental 1984 county population estimates by age, race, and sex.[3] As race was treated differently in the 1980 census than in previous censuses and other sources of administrative data, an adjustment was made in the classification of race. Persons of unclassified race, most of whom were of Spanish origin, were allocated to the white and nonwhite race categories in such a way as to approximate the race definition developed by the U.S. Office of Management and Budget (OMB).[4] This race definition is also reasonably consistent with the definition implied by other inputs to the model, although ambiguity in the coding of race is a potential source of error in any race projection.

[1] Donald B. Pittenger (1976), *Projecting State and Local Population*, Cambridge, MA: Ballinger Publishing Co., pp. 3-4.

The Economic-Demographic Model, designated preferred, is based on standard demographic projection procedures, but assumes employment growth to be the major determinant of migration in and out of the state and the counties for persons under 65 years of age. The model is therefore driven primarily by labor demand at the state and county level--subject to one major caveat. After the year 2000, employment growth was constrained significantly below historical rates, to rates consistent with existing level of national immigration, settlement patterns of immigrants from abroad, and the state's relative attraction to job seekers from elsewhere in the nation. Low fertility rates and the aging of the "baby boom" into retirement--in the absence of loosening of immigration quotas or other unforeseen events--can be expected to constrain employment growth.

The Historical Migration Model, like the Economic-Demographic Model, is a cohort-component projection. The assumptions regarding the base population, fertility, and mortality are the same as those of the economic model discussed above. Net migrants by age, race, and sex are determined by inference from 1980 to 1985 based on the census and the 1985 estimates, and converted to net migration rates. Rather than inferring migration under age 65 by economic factors, this model applies the past net migration rates directly to the population distributed at each projection interval. As this model uses established demographic techniques, its results, along with those of the Economic-Demographic Model, can be viewed as a range of future population alternatives.

[3] U. S. Bureau of the Census (1988), Current Population Reports, Series P-23, No. 158, *Methodology for Experimental County Population Estimates for the 1980's.*

[4] See pages 8-9 of Volume 1 for the discussion of modification and comparison of New Jersey's 1980 population by race before and after the modification.

The Zero Migration Model is presented as an illustrative projection of the population change that would occur in the total absence of net migration. As migration tends to be the major distinguishing factor in sub-national projection models, a model that eliminates it altogether can provide a useful analytic tool. Comparing the Zero Migration Model with either the Economic-Demographic or Historical Migration Models reveals the impact of migration on population growth according to each of the two models. Like the two models previously discussed, it is a cohort component projection.

The Linear Regression Model is presented primarily for comparison to the Economic-Demographic and Historical Migration Models. It hypothesized that the population growth observed in New Jersey and its counties from 1900 to 1987 will continue until 2030. Unlike the other three models, it is not a cohort component projection, but a simple extrapolation of past total population trends, as determined by ordinary least squares regression. Its main feature is the extensive history of total population data on which it is based.

As in the last set of population projections produced in November 1985 by this Division, no special adjustment was made for the employment growth brought about by the Atlantic City hotel-casino development, the development restrictions implied by the Pinelands Comprehensive Management Plan, or the potential impact of the Preliminary State Development and Redevelopment Plan. (For an explanation, see Volume I, pages 4 to 6)

LABOR FORCE PROJECTIONS

Projected civilian labor force is obtained by applying the projected age-race-sex specific labor force participation rates to the civilian noninstitutional population aged 16 years and over derived from the Economic-Demographic Model. The institutional and military population in each county are assumed to be constant at its 1980 level through the projection period. The projections of labor force participation rates are discussed in Volume I, pages 11 to 12.

There are some differences between the data on labor force and participation rates published in the decennial census reports and those in the U.S. Bureau of Labor Statistics' (BLS) publications. Numbers published by BLS are based on annual averages computed from sample surveys of approximately 0.07 percent households in the nation. The census, on the other hand, documents the labor force for the week immediately preceeding the census day, based on a sample of approximately 17 percent of the total population. The data in this report are more closely aligned with the decennial census figures.

PRESENTATION OF RESULTS

The first part of this report (Tables A1 - A5) presents projections of total population resulting from the four different models and projections of civilian labor force based on Economic-Demographic Model. The April 1, 1980 census figures and July 1, 1987 provisional population estimates are also included for reference.

Tables in the second part of this report (Tables B1 - B21) provide the five-year age-race-sex detail for the projected population in New Jersey's 21 counties according to the preferred Economic-Demogrpahic Model from 1990 through 2010, with age-sex detail from 2015 through 2030 in five-year intervals. In four counties, Cape May, Hunterdon, Sussex, and Warren, the nonwhite population in 1980 was deemed to be too small to produce reliable projections by age and sex. Therefore, age-sex distributions by race are omitted for these counties, although population by age and sex as well as total by race-sex are included. An upward revision of the Essex County population in the 1980 census is not included in the detailed tables as they are not distributed by age-race-sex. This results in a discrepancy of 188 persons in the population totals for Essex County in 1980. Furthermore, all projections are rounded to the nearest hundred persons.

The third part of this report (Tables C1 - C21) contains projections of civilian labor force by age, race, and sex based on the Economic-Demographic Model for the 21 counties in New Jersey from 1990 to 2010. The age-sex distribution by race in Cape May, Hunterdon, Sussex, and Warren counties are omitted due to the same reason as described above.

Also available on request, but not as a formal publication, are population by age, race, and sex according to the Historical Migration projections.

CAUTION ON INTERPRETATION

As noted at the outset, projections are not forecasts. The publication of four series is intended partly to demonstrate the varied nature of projection models. In addition, the Economic-Demographic and the Historical Migration models may be viewed as a range of population and labor force alternatives for New Jersey and its counties. The present set of projections is the first series produced by this Division that reaches to the year 2030, and includes detailed labor force figures to the year 2010. Particular caution is warranted in interpreting results beyond the year 2000, as the plausibility of historically based assumptions declines with increasing departure from the base year. Projections are by their nature biased in favor of continuity. There is generally little basis for projecting substantial departures from past trends, so few such departures are projected. Yet, there is little doubt that unforeseen changes will occur. In particular, the assumptions in the Economic-Demographic Model including the constraint on employment growth after the year 2000 are based on current and/or recent conditions which may change dramatically.

The Division of Labor Market and Demographic Research hopes that users of these projections, both interested agencies and individuals, will comment on them. Please direct all comments, suggestions, and requests to Labor Market and Demographic Research, New Jersey Department of Labor, CN 388, Trenton, New Jersey 08625-0388. The Demographics Unit can be reached at (609) 292-0076.

PART C.

Projections of Civilian Labor Force by Age, Race, and Sex

Table C1. Projection of Civilian Labor Force by Age, Race, and Sex: Atlantic County, 1990 to 2010

Race-Sex		Age Group						
Group	Total	16-19	20-24	25-34	35-44	45-54	55-64	65+
Census on April 1, 1980								
Total	90,574	6,300	12,650	22,720	16,156	15,034	12,880	4,834
Male	50,032	3,283	6,571	13,043	8,893	8,202	7,194	2,847
Female	40,542	3,017	6,079	9,679	7,264	6,832	5,686	1,987
White	75,118	5,153	10,731	18,986	13,060	12,226	10,996	3,967
Male	42,824	2,688	5,683	11,310	7,485	6,886	6,307	2,465
Female	32,294	2,465	5,048	7,676	5,575	5,340	4,689	1,502
Nonwhite	15,456	1,147	1,919	3,736	3,097	2,808	1,883	867
Male	7,208	595	888	1,733	1,408	1,316	887	382
Female	8,248	551	1,031	2,003	1,689	1,492	997	485
Projection to July 1, 1990								
Total	112,700	5,600	13,000	31,500	28,700	18,300	11,600	4,100
Male	60,300	2,800	6,700	17,400	15,400	9,400	6,300	2,200
Female	52,400	2,700	6,300	14,100	13,400	8,800	5,200	1,900
White	90,500	4,200	9,900	24,700	24,000	14,800	9,700	3,200
Male	50,400	2,200	5,400	14,100	13,400	8,000	5,500	1,900
Female	40,100	2,100	4,500	10,600	10,600	6,800	4,200	1,300
Nonwhite	22,200	1,300	3,100	6,800	4,700	3,500	1,900	900
Male	9,900	700	1,300	3,300	2,000	1,400	800	300
Female	12,300	600	1,800	3,500	2,700	2,000	1,000	500

Note: 1980 race distribution shown here differ from the 1980 Census in that they are adjusted to be consistent with national projections and other sources of administrative data. See Volume 1 for detail. Projections by age-race-sex are based on the Economic-Demographic Model and are rounded to the nearest hundred persons such that numbers may not add due to rounding.
